

A child dies every minute from malaria, a preventable and treatable disease.

Malaria is a parasite. It's transmitted between humans by female Anopheles mosquitoes — the world's deadliest animal.

Each year, there are an estimated

240M

malaria cases, and an estimated

600,000

deaths from the disease, with children under five and pregnant women most at risk.

**WORLD'S
DEADLIEST
ANIMAL**

1 in 3

pregnant women in sub-Saharan Africa will have malaria.

MALARIA =
LOST LIVES
LOST SCHOOL DAYS
LOST PRODUCTIVITY
LOST GROWTH
LOST POTENTIAL
LOST FUTURES.

For every

£1

spent on controlling malaria,

£36

would return in social and economic benefits

Since 2000, malaria deaths have halved thanks to global action.

But more than half the world's population are still living with malaria risk. We need funding and political action to end it for good.
